

Geo S12 ANALOGUE TDCONTROLLER

The S12 TDController is an advanced analogue processor that allows the S12 Series Loud Speaker and companion NEXO SubBass exceptional performance from mid-size packages

The S12 TD provides crossover, sensed-amplifier control and optimized system equalisation for any S1210/S1230 system.

Each S12 TD presents two inputs and three outputs, L, R and summed sub out, minimising installation cost and complexity.

Like all NEXO processors, the S12 TDController provides precision dynamic, voice coil temperature and diaphragm displacement protection via selective Voltage Controlled Equalizers (VCEQs). This reduces levels only at specific frequencies when and where necessary.

ALL GEO S1230 SPEAKERS COME WITH A S12 TDCONTROLLER

For more information please download the S12 TDController data sheet or the GEO S12 Brochure
